Working papers

Ticket to the middle class? Long term effects of Public Universities on Labor market and Financial outcomes. with Christian Posso. Job Market Paper

This paper examines how public higher education affects later-life labor market and financial outcomes by employing the admission policies of a selective public university. To do so, we construct a novel dataset from administrative sources linking educational outcomes, labor market and credit market outcomes up to 18 years after college entry for applicants to a university in Colombia. The university admission is based solely on the national high school exit examination. We estimate the effects of being just above the university admission cutoff using a fuzzy regression discontinuity design. Students above the cutoff are 7 percent more likely to graduate and observe 27 percent earning returns by their mid-thirties. Moreover, scoring just above the admission cutoff has a persistently higher effect on accessing consumer credit and higher probabilities of homeownership as measured by outstanding mortgage loans in the mid-thirties. The results on financial indicators provide evidence on the impact on college education on dimensions such as asset accumulation and financial inclusion describing economic wellbeing in the long term. .

Food assistance and mobility during COVID-19 lockdown 2021. with Juan Mogollon and Catalina Villamil.

This paper examines the effects of emergency food assistance on human mobility patterns between March and August of 2020. We study a large public-private initiative in Colombia, created to deliver food aid to one million households at risk of falling into poverty and previously not included in other assistance programs. The impact is estimated using the quasi-exogenous roll out of the food distribution within municipalities. The high-frequency data set links detailed daily deliveries with georeferenced food recipients' location and mobility indicators measuring out-of-home events. This information is then aggregated at the urban tract level. The estimation includes a rich set of fixed effects using sector, time and department-week trends. The main findings indicate that receiving food assistance delivered to the home reduced out-of-home mobility by 1.6 percent during a two-week window. The estimated coefficient after that window is imprecise, suggesting a short-term effect. The program reduced out-of-home activities by reducing visits to grocery stores. Delivering food assistance proved to be an effective intervention to reduce population movement, thus helping households in distress comply with national lockdown orders.
